

## WITSML Product Certification Program

Please complete this form and return to Jana Schey (Jana.Schey@Energistics.org) in advance of or along with the signed license agreement. Examples of processed forms as well as the downloadable license agreement are available on the Energistics website via Standards Resource Centre->Product Certification Program.

Q1	Product Name, Version, Description				
A1	PetroGistics Server, 1.8 Seamless flow of data between operators and service companies was a major requirement in the upstream oil & gas industry for speedy and enhanced decision making. To facilitate such collaboration, E&P companies need to adopt shared, integrated, IT technology to enable multi-disciplinary teams to engage in improved workflow processes. For this the data flow have to cross the barriers of proprietary software, need to be policy free, language neutral and the data transfer have to be secure, efficient and utilizing the minimum bandwidth. WITSML is a major initiatives in the upstream oil & gas industry to achieve this business objective of collaborative asset teamwork. The PetroGistics server is Perfomix's implementation of WITSML services following the Industry standards set by the global upstream oil & gas industry standards consortium Energistics (www.energistics.org).				
Q2	Vendor Name, Logo, Description				
A2	PERFOMIX INC, Perfomix is a global technology solutions provider for the petroleum industry focused on drilling performance excellence with integrated offering of real-time data and operations management products and services. Perfomix is committed to technology innovations for empowering people at the rig sites, real-time operation centers (RTOCs), offices and the Oil & Gas community. Perfomix provides highly flexible and cost effective products and software-as-a-service offerings to integrate well site data acquisition and operations systems with enterprise data management systems and specialized analysis applications. Perfomix PetroSocial solution suite for drilling performance surveillance and optimization with the virtual remote monitoring service can improve drilling performance, reduce well construction cost and avoid drilling hazards. Perfomix was founded by a team of experts with extensive experience in shaping and deploying state-of-the-art enterprises applications for the Oil & Gas and Manufacturing industries. Perfomix, with its competencies in real-time systems, business intelligence, portals and Web 2.0 technologies and ERP systems focuses on helping enterprises leverage innovative software solutions and hosted software services for maximizing business performance. The Perfomix team is passionate about the customers' business success and sustainable and predictable results – Business Performance at its best.				
Q3	Product Availability (from, to)				
A3	From December-14-09				
Q4	Form Submitter Information				
A4	Celestine Sebastian Vettical President and CEO Perfomix, Inc. One Greenway Plaza , Suite 930 Houston, TX 77046, United States of America, Phone : (713) 893-8610 Fax : (713) 777-532				

Q5	WITSML Functional Coverage. This is described in light of definitions provided directly on the form of functions of Client products as producers and/or consumers, of Server products as Receiving, Delivering, and/or Managing Servers. Functionality is summarized by checking which of sixteen overall functions are exhibited by the product.		
A5	Check all that apply. Explain limitations and/or special circumstances in the Comments area.		
	Notes:		
	<ul> <li>Functional coverage is organized according to five kinds of product functionality with respect to the WITSML Standards: two kinds of client functions and three kinds of server functions.</li> </ul>		
	A product may exhibit multiple kinds of functionality.		
	• The terms client and server are used here exclusively with respect to the WITSML Server API interfaces. Clients issue requests to servers. Servers receive and respond to requests from clients.		
	<ul> <li>Behaviors for products that do not use the WITSML Server API are classified in an analogous manner.</li> </ul>		
	The five product classifications of WITSML functional coverage are:		
	Client Products		
	<ol> <li>WITSML Producer Client a product that generates or otherwise obtains data that is formulated as WITSML object instances and sent to a WITSML Server to be incorporated in that server's data population. Examples of such products include products that pick up real-time data from sensor devices, format it, and send it to a server; and products that extract data from data stores, format it, and send it to a server.</li> </ol>		
	<ol> <li>WITSML Consumer Client a product that issues requests for data as queries of subscriptions to a WITSML Server and then receives data as query responses or subscription publications. Examples of such products include products that acquire data from a server, possibly reformat it, and delivery it to an application program or viewer utility.</li> </ol>		
	1&2. Products the exhibit combined Producer and Consume Client functions may be application programs that operate directly on a WITSML Server, such as a mudlogging application or a pore pressure analysis application.		
	Server Products		
	<ol> <li>WITSML Receiving Server a product that performs WITSML Server functions in general and, in particular, acquires data from external sources. Data acquisition may be through WITSML API interfaces or other mechanisms.</li> </ol>		
	<ol> <li>WITSML Delivering Server a product that performs WITSML Server functions in general and, in particular, delivers data to external destinations. Data delivery may be through WITSML API interfaces or other mechanisms.</li> </ol>		
	5. WITSML Managing Server a product that performs WITSML Server functions in general		

and, in particular, supports requesis from authorized client applications to augment (extend), modify, or delete (part or all) WITSML object instances.         384. The general understanding and expectation is that a product characterized as a WITSML Server supports both Receiving and Delivering Server functionality.         384.S. The addition of Managing Server functionality allows a WITSML Server product to do more than store and forward data, such as supporting data quality management client applications that help ensure the integrity and quality of data content in a Server data population.         General Functions       6. Virtually all products associated with the WITSML Standards will issue and/or process WITSML Server General Functions to determine the capabilities and version of a server product.         1. WITSML Producer Client A product that (generates and) sends WITSML object instances to a destination process:         1a			
Server supports both Receiving and Delivering Server functionality.         38485. The addition of Managing Server functionality allows a WITSML Server product to do more than store and forward data, such as supporting data quality management client applications that help ensure the integrity and quality of data content in a Server data population.         General Functions       6. Virtually all products associated with the WITSML Standards will issue and/or process WITSML Server General Functions to determine the capabilities and version of a server product.         1. WITSML Producer Client A product that (generates and) sends WITSML object instances to a destination process:         1a       Sends to a WITSML Server using AddToStore interface         1b       Otherwise         2. WITSML Consumer Client A product that requests and receives WITSML data from a source process:         2a       Queries a WITSML Server using GetFromStore interface         2b       Subscribes to a WITSML Server using Publish interface         2c       Otherwise         3. WITSML Receiving Server A product that performs the WITSML Server interfaces and receives data from source processes:         3a [ X] Receives WITSML object instances via AddToStore interface         3b [ X] Otherwise WITSML topiect instances or a virtual equivalent         4. WITSML Delivers WITSML the treat the at reated as if it were WITSML object instances and delivers data from source processes:         3a [ X] Receives WITSML topiect instances to a subscriptions via the Publish interface
